

Search Connector Solution

CONNECT • DEFINE • INDEX • SEARCH • SECURELY

eRESULT® Features

- **SharePoint Integrated Administration**
- **Advanced Security Mapping**
- **Real Time Security Validation**
- **Include Unstructured Data**
- **Advanced Metadata Support**
- **Conditional Metadata Support**
- **Multi-System Metadata Merge**
- **Easy Definition Builders**
- **Integrated Relevancy Tools**

eRESULT® Is All About The Metadata.

Metadata is all the related information that helps define and profile a document or record. Faceted navigation and advanced search rely on extended metadata to increase findability, and eResult provides the tools and features to discover and enhance that metadata.

Unlock Your Enterprise Data.

Companies rely on multiple systems for business, from document and customer management to internal custom applications. eResult provides the tools to map the existing relationships between the data in each line-of-business system **before** the data is indexed.

Define, Format & Control Your Metadata.

Wizard based metadata definition along with our unique scriptable formatting options provide unmatched control of your metadata. Combine fields, calculate new fields, rollup values, conditionally hide or show values, and leverage relationships of data.

One-To-Many Is Not A Problem.

Enterprise data is rarely definable with a single record and your metadata should reflect that. eResult easily and intelligently supports complex data relationships where you may have multiple values of a property.

Got Security? eRESULT® Is Enterprise Security.

Many enterprise business systems apply their own security models which don't map to SharePoint, and without proper mapping it is nearly impossible to secure that data. eResult provides the tools to map each system's disparate security before indexing for true enterprise scale security.

Real Time. Just In Case.

Be comfortable that the security change you just made will be enforced even between index updates. eResult's batch optimized real time security trimming is unique in its application; as a second level of security it has little impact on relevancy and query performance.

eRESULT® Is An Extensible Framework You Can Build Upon.

Partner with us to create your own connectors on our framework. Our framework makes establishing connections easy with a host of features to guide you such as wizards for generation of metadata, integrated testing tools, and template creation and re-use.

eRESULT® Connectors

- MS Exchange Mailboxes
- EMC Documentum
- Interwoven WorkSite
- OpenText Hummingbird
- SQL Server Universal
- OLEDB Universal

Universal Connectors (BDC For The Search Server).

eResult features three Universal connectors (SQL Server, OLEDB and WebServices) that provide the means to quickly connect to and index all your custom enterprise systems. Define content, map security, customize metadata, include **unstructured data** and even merge metadata from multiple systems. For systems with proprietary API access only, we provide you with a web services connector.

Documentum Connector.

A truly secure enterprise scaling connector for EMC Documentum. Only through our combination of Active Directory mapping and real time security can Documentum's complex security model be truly supported. eResult scales to support all your docbases and provides granular filtering and content definition.

Hummingbird Connector.

Full support of PCDocs 4 and DM 5 with all the security and metadata mapping features our framework offers. Trust that our model is stable enough to index your largest data stores and fast enough to update multiple times daily and secure to the instant.

WorkSite Connector.

Index your client documents from WorkSite and add related client metadata from your customer relationship system to enhance find-ability of your documents. Our connector can work with all WorkSite SharePoint webparts and 3rd party integrations.

MS Exchange Private Mailbox Connector.

Shouldn't "Enterprise" Search include your email system? eResult for Exchange enables SharePoint Search of all private Exchange Mailboxes with full security, features and functionality, so that you can use SharePoint as your true single Enterprise Search solution. The only connector that allows for search of private Exchange mailbox stores from MOSS 2007 and Search Server 2008. **Ideal For Corporate Discovery.** Our system allows you to grant specific users and groups search rights across all mailboxes. This provides the means for corporate council or compliance to always have access to the information they need.

Partner Based Connectors.

Partner with us to co-develop your search connector and benefit from all of our features.
